

What is claimed is:

1. An operator system for a motorized barrier, comprising:
 - an operator which controls the motorized barrier, said operator capable of receiving wireless signals to control the motorized barrier;
 - a device which controls an electrical load, said device capable of receiving wireless signals to control said load; and
 - at least one transmitter capable of generating wireless signals receivable by said operator and said device for independent operation of each.
2. The system according to claim 1, wherein said at least one transmitter is selected from a group consisting of a wall station transmitter, a remote transmitter, and a keyless entry transmitter.
3. The system according to claim 2, wherein said operator and said device both receive only the same frequency wireless signals from said at least one transmitter.
4. The system according to claim 1, wherein said device is a fixture that controls a light.
5. The system according to claim 4, wherein said fixture comprises:
 - a transceiver for at least receiving said wireless signals; and
 - a controller connected to said transceiver, wherein said controller validates said wireless signal and controls said light if said wireless signal is validated.
6. The system according to claim 5, wherein said fixture further comprises:
 - a program button operative with said controller;
 - a memory device associated with said controller, and
 - wherein actuation of said program button places said controller in a learn mode such that any valid signal received while in said learn mode is stored in said memory device.

7. The system according to claim 6, wherein said controller is able to distinguish between said group of transmitters, and wherein said at least one transmitter is selected from a group consisting of a wall station transmitter, a remote transmitter, and a keyless entry transmitter.
5
8. The system according to claim 7, wherein said remote transmitter has plurality of function buttons, and wherein actuation of a first button of said remote transmitter in said learn mode designates said first button as a barrier command, and wherein actuation of any other button of said remote transmitter while in said learn mode designates said other button as a work light command.
10
9. The system according to claim 8, wherein generation of said barrier command by said at least one transmitter is receivable by said operator and said fixture for illumination of said light for only a predetermined period of time.
15
10. The system according to claim 9, wherein generation of said work light command by said at least one transmitter illuminates said light if in an off condition, and returns said light to said off condition only if no door command had been previously received within a designated time period.
20
11. The system according to claim 10, wherein generation of said barrier command is specifically limited to valid first buttons learned from said remote transmitters, said keyless entry transmitter, and selected buttons from said wall station transmitters.
25
12. The system according to claim 11, wherein said selected buttons of said wall station transmitters include an up/down button, a delay close button, a pet height button, and a door profile button.
30
13. The system according to claim 10, wherein generation of said barrier command while said light is illuminated as a result of receiving said work light command causes said controller to turn said light off after a predetermined period of time.

14. The system according to claim 1, wherein said device is a switch that controls a load.
- 5 15. The system according to claim 14, wherein said switch further comprises:
a transceiver for at least receiving said wireless signals; and
a controller connected to said transceiver, wherein said controller validates said wireless signal and control said load if said wireless signal is validated
- 10 16. The system according to claim 15, wherein said switch further comprises:
a program button operative with said controller;
a memory device associated with said controller, and
wherein actuation of said program button places said controller in a learn
15 mode such that any valid signal received while in said learn mode is stored in said memory device.
17. The system according to claim 16, wherein said controller is able to distinguish between said at least one transmitter, and
20 wherein said at least one transmitter is selected from a group consisting of a wall station transmitter, a remote transmitter and a keyless entry transmitter.
18. The system according to claim 17, wherein said operator is capable of generating wireless signals and wherein said controller is able to distinguish operator
25 wireless signals and transmitter wireless signals.
19. The system according to claim 18, wherein said switch further comprises:
an on button connected to said controller;
an off button connected to said controller;
30 a switch on indicator connected to said controller; and
a switch off indicator connected to said controller;
a memory device associated with said controller; wherein
one of said buttons function as a program button operative with said controller

when actuated for a predetermined period of time to place said controller in a learn mode such that any valid signal received in said learn mode is stored in said memory device.

- 5 20. The system according to claim 19, wherein the learning of a valid transmitter wireless signal and a valid operator wireless signal by said controller initiates illumination of one of said indicators in a predetermined manner.
- 10 21. The system according to claim 20, wherein receipt of said valid wireless signal by said controller when not in said learn mode causes said switch to turn said load on if previously off for a predetermined period of time.
- 15 22. The system according to claim 20, wherein receipt of said valid wireless signal by said controller when not in said learn mode causes said switch to turn said load off if previously on.
- 20 23. The system according to claim 19, wherein said switch on indicator is active when said load is active and said switch off indicator is active when said load is inactive.
- 25 24. The system according to claim 23, wherein actuation of said on button turns said load on and precludes said controller from receiving any wireless signals, and wherein actuation of said off button turns said load off and allows said controller to receive any valid wireless signals.
- 30 25. An operator system for a motorized barrier, comprising:
 an operator which controls the motorized barrier, said operator capable of receiving wireless signals to control the motorized barrier, and said operator capable of generating wireless signals;
 at least one transmitter capable of generating wireless signals; and
 a device which controls an electrical load, said device capable of receiving wireless signals generated by at least one of said operator and said at least one transmitter to enable operation of said device.

26. The system according to claim 25, wherein said operator and said device both receive wireless signals from said at least one transmitter having only the same frequency.
- 5
27. The system according to claim 25, wherein said device is a fixture that controls a light.
28. The system according to claim 25, wherein said device is a switch that controls a load.
- 10
29. The system according to claim 25, wherein said at least one transmitter generates said wireless signals at a first frequency and said operator generates wireless signals at a second frequency.
- 15
30. The system according to claim 29, wherein said operator generates said wireless signals at said second frequency upon receipt of said wireless signals at said first frequency.
- 20
31. The system according to claim 25, wherein said operator generates said wireless signals at a first frequency upon receipt of said wireless signals from said at least one transmitter at said first frequency.
32. A system for controlling electrical loads, comprising:
- 25
- at least one device which controls an electrical load said device capable of receiving wireless signals to control said load; and
- at least one transmitter having at least one function button, wherein actuation of said at least one function button generates a wireless signal receivable by said at least one device.
- 30
33. The system according to claim 32, wherein said at least one device comprises:
- a controller; and
- a program button connected to said controller, wherein actuation of said

program button places said controller in a learn mode for a predetermined period of time, and wherein actuation of said at least one function button during said predetermined period of time associates said at least one function button with said electrical load.

5

34. The system according to claim 33, wherein said at least one function button is associated with more than one said device.

10

35. The system according to claim 33, wherein said at least one device is associated with more than one said transmitter.

36. The system according to claim 33, wherein said at least one function button is associated with more than one device; and wherein said at least one device is associated with more than one said transmitter.

15

37. The system according to claim 33, further comprising:
a memory device associated with said controller for storing a valid signal received during said learn mode.

20

38. The system according to claim 33, wherein said at least one device is a fixture that controls a light.

25

39. The system according to claim 33, wherein said at least one transmitter is selected from a group consisting of a wall station transmitter, a remote transmitter, and a keyless entry transmitter.

40. The system according to claim 33, wherein said device is a switch that controls a load.

30

41. The system according to claim 40, wherein said switch further comprises:
a transceiver for at least receiving said wireless signals; and
said controller connected to said transceiver, wherein said controller validates said wireless signal and controls said load if said wireless signal is

validated

42. The system according to claim 41, wherein said switch further comprises:
a memory device associated with said controller such that any valid signal
5 received while said controller is in said learn mode is stored in said memory
device.
43. The system according to claim 42, wherein said controller is able to distinguish
between said at least one transmitter, and
10 wherein said at least one transmitter is selected from a group consisting of
a wall station transmitter, a remote transmitter and a keyless entry transmitter.
44. The system according to claim 43, wherein said switch further comprises:
an on button connected to said controller;
15 an off button connected to said controller;
a switch-on indicator connected to said controller; and
a switch-off indicator connected to said controller;
a memory device associated with said controller; wherein
one of said buttons function as a program button operative with said controller
20 when actuated for a predetermined period of time to place said controller in a
learn mode such that any valid signal received while in said learn mode is stored
in said memory device.
45. The system according to claim 44, wherein the learning of a valid transmitter
25 wireless signal and a valid operator wireless signal by said controller initiates
illumination of one of said indicators in a predetermined manner.
46. The system according to claim 45, wherein receipt of said valid wireless signal
by said controller when not in said learn mode causes said switch to turn
30 said load on if previously off for a predetermined period of time.
47. The system according to claim 45, wherein receipt of said valid wireless signal
by said controller when not in said learn mode causes said switch to turn

said load off if previously on.

48. The system according to claim 44, wherein said switch-on indicator is active when said load is active and said switch off indicator is active when said load is inactive.
- 5
49. The system according to claim 48, wherein actuation of said on button turns said load on and precludes said controller from receiving any wireless signals, and wherein actuation of said off button turns said load off and allows said controller to receive any valid wireless signals.
- 10
